

Consistency, continuity, and accountability in Instructor Guides

Materials

For VILT:

- Internet connection
- Zoom or other conference
- Slide deck
- Instructor Guide Template (MS Word)
- PDF sample of course IG

For ILT:

- Laptop or computer
- Projector
- Slide deck
- Instructor Guide Template (MS Word)
- Print out samples of IG

Objectives

- Define the terms "continuity, consistency, and accountability" as they relate to law enforcement training.
- Evaluate past and current training materials for continuity, consistency, and accountability.

Poll – what should be in an instructor’s guide? – 3 min

Options:

- **the least possible: a basic bullet list of subjects**
- **as little as possible: an outline with a few lines on what should be discussed**
- **outlined information with some examples, questions, and explanation of activities**
- everything that an instructor should say, prompts for discussions, activities explained with expected outcomes, teaching tactics and strategies, and additional background

An instructor guide should contain all the information that an instructor expects a participant to walk away with. It should identify discussions, activities, strategies, and be in a manuscript – textbook – format.

Why consistency

Training without consistency is nothing more than checking a box. For this course, we will define consistency as:

Consistency, in the cause of learning, is the accuracy of information, reliably transferred, so that the performance measured upon completion of training yields highly similar results.

What this means is that after every iteration of training, despite who delivered it, the bell curve of results should show a very high-level of learning transfer. How that is done starts with the Instructor’s Guide (IG).

Consistency in training means that you can create reproduceable results – this is science and evidence. It means that no matter who teaches a course, to whomever the audience may be, the participants demonstrate an expected performance outcome. It also shows that all personnel were trained to the same consistency, so aberrations can be more successfully identified.

If there is a history of high success, with consistent results, and suddenly there is an aberration, it provides a more targeted examination. Was it the class? Was it the instructor? Or was it something else that can be investigated?

Without consistency these investigations are, at best, subjective evaluation and guesswork, at worst, blame and rejection.

Why continuity

Continuity, in learning, means the consistent delivery of the same information over time and between iterations of training and in between other courses.

In movies, it means the details are the same in different scenes. In math it means that a function does not have abrupt changes in value and that small changes in output can be adjusted by small changes in inputs. In business and leadership, especially in law enforcement, it means a continuous chain of command or a plan of succession if there are changes in leadership.

If the courseware content in an IG contains everything an instructor and participant needs, then it will have consistency, continuity, and accountability. This includes all information and background, as well as instructor prompts, discussion questions with summaries, activities articulated with expected results (assessments are activities), instructor preparation notes, and specific instructions within the content to include timing, presentation, and resources.

You can only have accountability with reproduceable results. The less information provided, the more randomness in presentation and the more likely material can be included that will go unaccounted for.

How we achieve it

The “Is law enforcement a profession?” experiment

The following story was a demonstration at the IADLEST 2019 conference in Milwaukee, WI. It comes from a presentation by Rick Jacobs called “Experience is only context, not content.”

The “Is law enforcement a profession?” experiment

- Three volunteers: two with a bullet point, one with a paragraph
- Each given five minutes to study, then each presented alone
- Two gave identical presentations
- One gave the presentation intended by the bullet point
- All did very well (experienced instructors)
- All provided accurate, factual information
- Only one presented what the course required

A presenter conducted an experiment to illustrate a point at a conference for instructors and academy directors. The presenter asked for three volunteers to take a sheet of paper, study it for five minutes, and then present the topic to the class.

The first two were given a sheet with a bullet point from a state’s training on law enforcement ethics that stated “Describe how law enforcement is a profession.”

The third subject’s sheet had the same prompt “Describe how law enforcement is a profession” but also included a paragraph from the training that described how law enforcement is a profession because it requires training, yearly professional development, state board certification, a set of rules and ethics that must be adhered to, has established qualification criteria, etc., then examples of how those impact the profession.

One at a time, they were brought back into the group. The two with a bullet point only presented first. They both described the requirements of how to become a law enforcement officer: age, training, and other criteria.

The third person came in and presented the material that he had been provided - the bullet point and the supporting material.

The group was stunned. All three gave technically correct and accurate information. Only one actually answered the prompt. Of the first two, one was an academy director with over 30 years of law enforcement experience, the second an academy employee and instructor with a decade of experience. The third was an academy deputy director from a foreign country, with no US law enforcement experience.

It was clear that more information provides a more accurate result when instructing participants and reduces the need for instructors to interpret and assume the content.

Horizontal lines for notes.

It starts where a lot of training development currently ends.

An exceptional quantity of training content amounts to not much more than an outline. Sometimes the outline has a little more information; sometimes it will include a few more instructions. However, this cannot be the end of it. When an instructor is left to interpret what is needed to be transferred, the content is no longer consistent. If it is not consistent, there is no continuity, and thus there can be no accountability.

Horizontal lines for notes.

The good news is that instructors who develop their own training materials already have the basics down and are only missing a few vital steps further in development. To get to the point of an outline is tremendous work and is, ultimately, one of the most important parts of training development. It is literally the pivot point where training goes from analysis, research, and design to full development.

The order of development

We will start where most training ends – the outline.

Whether it is in a Roman numeral format or other such list, development starts where the outline ends. The outline provides the framework for the course in its entirety.

- Click for Add TPOs -

Once the outline is complete, then the Performance Objectives are developed (training/learning objectives). The top level of the outline (what would be in Roman numerals in a traditional outline) are your Terminal Performance Objectives.
